

ABSTRACT OF THE DISCLOSURE

An image recorder has a storage for a visual broadcast program. The image recorder makes a question of whether or not the data of the visual broadcast program is to be automatically deleted from the storage after the playback of the visual broadcast program is terminated. The image recorder makes it possible to interrupt the storage of a selected one of a plurality of visual broadcast programs with the storage of at least another visual broadcast program continued. The image recorder is capable of recording both the data of visual broadcast program and digital image data from another source, the priority is given to the data of visual broadcast program over the digital image data.
